2250. DEHYDRATION OF MEDIUM AND NATURAL HYDROCARBONS. (2250). The author
of the paper (Narita (Petroleum), 1970, No. 1, p. 10-100) considers the conditions under which medium and natural hydrocarbons can be dehydrated by adsorption on activated alumina. The author also presents experimental data, showing the effect of adsorption of naturally occurring adsorbents possessing capillary surface activity. Since the effect of adsorption is strongly influenced by the rate or flow of the gas, the choice of the correct contact time is important. The dehydration under elevated pressures and industrially applicable space velocities is 100% until the saturation of the adsorbent reaches 15-17% by weight. The properties of the activated aluminas used in this investigation are described and the conditions of adsorption and reactivation processes are given.

HUNG,

Natural zeolites are an adsorbent for drying natural gas. D. Gjurovic (M4/0, ZAGREB, 1964, 6, 103-106). Natural gas is dried by passing it through hydargillite activated at 450-600° under pressure of 1-10 atm. and at appropriate flow velocities. The adsorbent should be regenerated when its water content reaches 14-18%, by passing dry gas over it at 300-500°. H. Tauscic.

NAME	: Lundström, B.; Ljungqvist, A.
TITLE	: Inhibition of polymerization of styrene in water
ORTG. PUP.	: LUND (Lundsk.), 1960, p. 21, 26
ABSTRACT	: An inhibition of styrene polymerization, particularly in water, is described. It is found that styrene polymerizes in water at pH 7.5-8.5. At pH 7.5-8.5, the polymerization rate is proportional to the concentration of styrene, the concentration of the inhibitor, and the square of the concentration of the initiator. The inhibitor is copper(II) chloride which is reduced to copper(I) by stabilized carbon disulfide. Copper(I) is a strong catalyst for styrene polymerization.

ABSTRACT : $^{100}\text{Ru}^{73}$, a radioactive isomer, and its half-life, stability of emission, etc. The isotope of $^{100}\text{Ru}^{73}$ is obtained from $^{100}\text{Ru}^{73}$ by thermal neutron irradiation of RuO_2 and separation of the RuO₂. The separation is performed by the method of ion exchange column chromatography which is based on the difference in ion radius between $^{100}\text{Ru}^{73}$ and $^{100}\text{Ru}^{76}$ and $^{100}\text{Ru}^{77}$ of RuO₂. At a temperature of 10°C of $^{100}\text{Ru}^{73}$, no decrease of $^{100}\text{Ru}^{73}$ was observed at 10°C and desorption of $^{100}\text{Ru}^{73}$ in the field contained 0.0004% of impurity, i.e., the yield

ABSTRACT: An experiment was performed on 49 workers employed in a large industrial
establishment in Silesia to study the effects of stress on the human body. Of these, 25 worked
under stress of noise, vibration, and dust, and the remaining 24 were employed as
designers working without noise or vibration. A statistical evaluation of the results showed a
26% increase in the activity of aspartic transaminase and a statistically significant decrease

ABSTRACT : It is established that in the addition of NaCl to the reduction of NaClO₃ to ClO₂, in addition to the aid of SO₂ in the hydrochloric acid, there occurs, in the intermittent manner, the formation of ClO₂ in concentrated chlorine solutions, as well as in the continuous manufacture from dilute solutions. The calculations indicated that in the addition of NaCl, the yield of ClO₂ (based on the reacted NaCl),

Szybka miarzczkowa metoda oznaczania zawartości P_2O_5 w próbach superfosfatu i supertomasyny" Przemysł Chemiczny No 1. 1951. pp. 24-29, 2 figs

The authors submit a volumetric method for quantitative determination of P_2O_5 , the accuracy of which is very similar to the gravimetric methods. Cheapness of the method (cheap reagents, expensive quantitative filters are not necessary), simplicity (long combustion is omitted) and rapidity make this method specially useful in technical laboratories of the fertilizer industry. The time saved by this method as compared with the gravimetric methods is about 58% in the case of superphosphate and 64% in the case of "supertomasyna" containing phosphorus.

Title : Effect of the Juice of Fresh and Dehydrated Cabbage on Gastric Secretion and Motility

Orig Pub : Vopr. pitaniya, 1957, 16, No 4, 19-26

Abstract : In the majority of patients with different ailments, the juice of fresh or dehydrated cabbage (150, 200 and 250 ml.) raised considerably the secretion and acidity of the gastric juice, and increased the strength and frequency of peristalsis (maximum after an hour). Cabbage juice is a stronger irritant than a coffee breakfast or mechanical irritation of the stomach. The juice is recommended as a therapeutic agent in hypoacidity, low peristalsis and gastric atonia.

SOV/65-58-9-7/16

TITLE: Comparing the Effectiveness of Additives which Prevent
the Sedimentation of Lead Deposits in Ethylated Petrols..
(Sravneniye effektivnosti prisadok, predotvrazhayushchikh
vypadeniye svintsovых osadkov iz etilirovannykh benzinov)

PERIODICAL: Khimiya i Tekhnologiya Topliv i Mysel, 1958, Nr 9,
pp 35 - 37, (USSR)

ABSTRACT: Anti-oxidants such as 2,4,5-trialkylphenols and N-substi-
tuted paraminophenols are used predominantly for this
purpose; parahydroxydiphenylamine (N-phenylparaminophenol)
(Refi 1 and 2) are used in the USSR and N-butyldipamino-
phenol and 2,6-di-tert.-4-methylphenol (BMP) in the USA
and other Western countries. The authors compared the
effectiveness of BMP and of parahydroxydiphenylamine as
stabilisers preventing the sedimentation of lead deposits
in ethylated aviation fuels. Their effect as inhibitors
was also tested. Samples of the fuel were heated in
sealed glass ampules over a water bath. The concentration
of the stabiliser was so adjusted that its concentration
in the fuel = 0.002, 0.004 and 0.006%. Data on the
effectiveness of the investigated stabiliser in various

Card 1/2

SOV/45-58-8-7/16

Comparing the Effectiveness of Additives which Prevent the Self-ignition
of Lead Deposits in Ethylated Petrols..

types of fuel is given in Table 1. When small quantities of BIF were added the time of stabilisation increases. Table 2: data on the stability of fuel mixtures containing equal quantities of BIF and parahydroxylphenylamine. The fuels were mixed in the ratio 1:1. It was concluded that the addition of 0.004% of BIF ensures high stability (time of stability against separation of deposits exceeds 24 hours). At equal concentration, parahydroxylphenylamine is more efficient than BIF. It was also found that increased activity resulted when the two anti-oxidants were added to the fuel. There are 2 Tables and 7 References: 4 Soviet and 3 English.

TITLE: Honeycomb Plastics, Their Properties, Methods of Their Production, and Their Fields of Application

PERIODICAL: Plasticheskiye massy, 1960, No. 10, pp. 42-46

TEXT: This report deals with properties of honeycomb plastics on paper, cotton tissue, and glass fabric base. Products on paper base are said to be preferable because of their inexpensiveness. The following data are supplied for various resins, paper type MT-63 (IP-63) and 7-mm large cells:

Bitumenous varnish 177	Carbamide resin type MФ (MFF)	Phenolformaldehyde varnish type P-21 (R-21)	Epoxy resin (ED-5)
compressive strength kg/cm ²	1	3.4	7.7
weight by volume, g/cm ³	0.04	0.07	0.096
water absorption, %	10	3	1.5
			1.1

Application

S/191/60/000/C10/010/017
B004/B060

The cells impregnated with phenol formaldehyde varnish are too brittle, and epoxy resin is too expensive. Carbamide resin was therefore preferred. Paper impregnated therewith does not burn any further, once it is removed from the flame. Brittleness can be reduced by diluting the resin with water, but stability is then impaired. Less brittle material is obtained with M $\bar{\rho}$ -17 (MF-17) carbamide resin. Honeycomb plastics from IP-65 paper and MFF resin retain their stability after seven days of staining in water. The compressive strength differs depending on the direction of stress. The following values are given for 5 mm cells (in kg/cm²): 12-14 parallel to the wall of cell; 1.15 in perpendicular to the side of cell, and 0.5 in perpendicular to the edge of cell. For cotton plastics with R-21 varnish the compressive strength parallel to the cell wall amounts to 70-80 kg/cm², for glass reinforced plastics with ED-5 resin 90-100 kg/cm². Tests conducted jointly with the nauchno-issledovatel'skiy institut kholodil'noy promyshlennosti (Scientific Research Institute of Refrigeration Industry) yielded for honeycomb plastics with 7-mm cells a coefficient of heat conductivity of 0.083 kcal/m h °C parallel to the cell wall, and of 0.057 kcal/m h °C perpendicular to the cell wall. An

addition of aluminum powder leads to a further reduction of heat conductivity due to heat reflection. A test for stability to frost (-30°C. thawing at 100% air humidity) proved the stability of the material. A method for the continuous production of such a material was worked out at the NIIPM (Scientific Research Institute of Plastics). Honeycomb plastics are used as insulating materials in the building industry. They are produced by profiling the paper by means of chilled rolls, gluing, stretching, and drying. The following types were experimentally produced and respective data are given:

Borovskich et al. (Luminescence), 5th, 1971

Methods: Luminescent Analysis, Materials: Luminescence Methods for Luminescent Analysis; Materials of the USSR: Chemistry, Miner. Ed. no. 41, 1961, 121 p., 1,000 copies printed.

Sponsoring Agency: Akademika Nauk Ukrainskoy SSR. Institute 51-111.

General Ed.: V. A. Borovskich; Ed.: I. T. Stepanov; Transl. Ed.:

I. G. Svirid. This collection of articles is intended for chemists and phys. sci. interested in molecular luminescence and its applications in research in the life sciences.

CONTENTS: The collection contains of papers from all the Soviet Union on luminescence which took place during 1960-1970, i.e., with the development of new luminescence methods for practical use and palliative chemical analysis and also the applications of luminescence methods for the determination of organic products, separation, distillation, boron and other elements, as well as instrumentation principles for the detection of light emitted by the detection of light with photovoltaic elements, etc. The application of the method of luminescence for luminescence analysis is described. The existence was not concerned with studies on the properties of crystal phosphors. There is a discussion on the contribution of Soviet specialists in molecular luminescence in the course of the first and second preceding the conference. The articles of V. K. Kurnev (p. 7) and of V. V. Pecherger (p. 73) have been included because of their importance. No personnel lists are provided. References accompany most of the articles.

This author reports on his synthesis of an organic lumophore

lumophore which exhibits an unquenched luminescence after exposure to ultraviolet light. The new lumophore has

been shown to be anisotropic in fluorescence in the electric and electronic vicinity due to the de-

tection of light in the walls of glass products, and is 10 times more luminescent than the standard lumophore of the same luminescence.

PERIODICAL: Referativnyy zhurnal. Fizika, no. 9, 1961, 101, abstract 9V204 (v
sb. "Metody lyuminestsentn. analiza", Minsk, AN BSSR, 1960, 83-86)

TEXT: It was discovered that adsorption of water, especially at low vapor pressure, reduces the intensity of fluorescence of rhodamine 6^{AM}(6Zh) adsorbed on cellulose. At transition to capillary condensation of water the further intensity drop is insignificant. The authors propose to utilize the phenomenon discovered for developing a method of checking the content of adsorbed water in cellulose during its drying. Besides rhodamine other luminescent dyestuffs (auramine, trypaflavine) can be used for this purpose.

TITLE: Influence of temperature on the luminescence of complex molecules in
different media [Report of the Eleventh Conference on Luminescence held in Minsk
from 10 to 15 September 1962]

SOURCE: AN SSSR. Izv. Seriya fizicheskaya, v. 27, no. 6, 1963, 753-762

TOPIC TAGS: luminescence of complex molecules, phthalimides, absorption of
solutions, luminescence of solutions

ABSTRACT: Investigation of the temperature dependence of different
characteristics of luminescence is important from the standpoints of elucidating
the properties of fluorescing molecules and determining the nature of
intermolecular interactions in condensed media. The solvents used in such
investigations may be divided into two classes: those vitrifying and those
crystallizing at low temperatures. In the present work there are considered the
temperature dependences of a number of phthalimides in vitrifying solvents.

Card 1/3

7

L 9860-63
ACCESSION NR: AP3001354

Most of the phthalimides were identical with those investigated earlier by the authors; the solvents were ethyl and isobutyl alcohols, glycerol, n-hexane, n-octane, dioxane, ethyl ether and chlorobenzene. A major difficulty in obtaining absorption spectra stems from the fact that upon freezing the solution form a snow-like mass in which scattering is comparable to absorption; hence the absorption spectra were obtained by the method of diffuse reflection. For phthalimide and N-methylphthalimide some structure is discernible in the absorption spectra at room temperature; upon cooling, instead of becoming sharper, the structure is smeared out; no structure was observed for the other investigated phthalimides. On the basis of the temperature dependences the substances can be divided into two classes: 1) those in which both the absorption and fluorescence peaks exhibit a red shift upon cooling and 2) those in which the fluorescence changes, while the absorption spectrum remains the same. For most but not all the investigated substances the reciprocal of the polarization varies linearly with the temperature divided by the viscosity. The quantum efficiency and lifetime of the excited state appear to vary in the same way with temperature. "In conclusion the authors express their gratitude to V. V. Belinskij and I. I. Reznikova for making the phthalimides available and I. I. Reznikova for performing some of the measurements of the temperature dependences of the excited

molecule, respectively, ϵ -- static dielectric constant of the medium, n -- refractive index of the medium extrapolated to zero frequency, a -- parameter of the given molecule, c -- velocity of light, h -- Planck's constant, τ' -- lifetime of the excited molecule, and τ -- relaxation time of the solvent molecule. An analysis of this formula shows that the frequency difference becomes appreciable on going from low temperatures to room temperatures, owing to orientational effects. The calculations of the dipole moments by this formula were made by using data on the temperature shift of the spectra in isobutyl alcohol in the temperature range from +20 to -196°C. The results are listed in Table I of the enclosure. The data are compared with those obtained by others and some of the causes for some of the discrepancies are discussed. The authors thank Academician A. D. SSSR A. N. Sevchenko for continuous interest in the work. This report was presented by A. N. Sevchenko. Orig. auth. has: 1 cable and 1 formula.

SOURCE: Optika i spektroskopiya, v. 17, no. 2, 1964, 209-212

TOPIC TAGS: aromatic compound spectrum, electron transition,
luminescence, fluorescence, phthalimode, benzene

ABSTRACT: In order to obtain a more reliable determination of the characteristic electron-vibration frequencies in each spectral band, and to trace their variation from compound to compound, the absorption spectra of benzene, toluol, benzoic acid, phthalic acid, phthalic anhydride, and phthalimide were measured at low temperatures using solvents that either vitrify or crystallize upon cooling (ethyl alcohol and dioxane, respectively). Analysis of the data shows that each of the spectra of all the substances contain funda-

ACCESSION NR: AP4043007

mentally two frequencies, one corresponding to the completely symmetrical vibration of benzene (964 cm^{-1}) and one to the incompletely symmetrical vibration (528 cm^{-1}). Consequently the spectra of all these compounds are governed essentially by the cloud of π electrons of the benzene ring, disturbed by the substitutes to a lesser or greater degree. It is shown that the frequency of the electron transition in phthalimide does not correspond to the symmetry frequency of the spectra, as is frequently assumed, but to the region of the maximum of the absorption band. Experimental data to confirm this conclusion are cited. Orig. art. has: 2 figures and 1 table.

REF SOURCE: Tr. Komis. po spektroskopii. AN SSSR, t. 3, vyp. 1, 1964, 319-326

TOPIC TAGS: electron spectrum, nonmetallic organic derivative, absorption spectrum, complex molecule

ABSTRACT: The authors investigated the electronic absorption and reflection spectra of a number of very simple derivatives of benzene and phthalimide in solutions at room and lower temperatures. The character of the long-wave absorption of phthalimide is analyzed on the basis of the change in the long-wave absorption band in a number of substances with different substituent groups. The Stepanov universal relation is applied to the absorption and emission spectra of frozen solutions of complex molecules. [Translation of abstract]
